DATE: 1/9/2026

TITLE: The College Assignment Submission Tracker

GITHUB LINK : <https://github.com/prithviai2005/BRU-.git>

1. ABSTRACT

The College Assignment Submission Tracker is a React-based web application developed to help college departments manage and track student assignments efficiently. The application allows faculty to add assignments with details such as title, subject, and due date, and update their submission status as Submitted, Pending, or Late. Faculty can also filter assignments based on subjects and view a dashboard containing summary counts. The system provides a simple and

user-friendly interface that reduces manual tracking and helps faculty quickly understand the overall assignment submission status.

2. PROBLEM STATEMENT

In colleges, faculty often track assignment submissions manually using notebooks, spreadsheets, or separate records for different subjects. This makes it difficult to identify pending and late assignments quickly. Managing assignments across multiple subjects can also consume time and may lead to errors. Therefore, a simple web-based system is needed to organize assignment details and display submission statuses in one place.

3. OBJECTIVES

- ☐ To develop a simple assignment tracking web application.
- ☐ To add assignments with title, subject, and due date.
- ☐ To mark assignments as **Submitted, Pending, or Late**.
- ☐ To filter assignments based on subjects.
- ☐ To display dashboard summary counts.
- ☐ To provide an easy-to-use interface for faculty.
- ☐ To reduce manual work in assignment tracking.

4. PROJECT SCOPE

The project focuses on providing basic assignment management and tracking functionality for college departments.

Included Features:

- Add new assignments.
- Enter assignment title, subject, and due date.
- Update assignment status.
- Display Submitted, Pending, and Late assignments.
- Filter assignments by subject.
- Show total assignment statistics on the dashboard.

- Responsive and user-friendly React interface.

Future Enhancements:

- Student login and faculty login.
- Database integration.
- Student-wise assignment tracking.
- Email or notification reminders.
- Cloud storage.
- Assignment file upload.
- Online deployment and authentication.

5. TECHNOLOGIES USED

Technology	Purpose
HTML -	Structure of the application
CSS -	Styling and responsive design
JavaScript -	Application logic
React.js -	Frontend development
React Hooks -	State and component management
Vite -	React project setup and development
Git -	Version control
GitHub -	Source code repository
VS Code -	Code development

6. APPLICATION FLOW

The application works through the following steps:

1. The user opens the **College Assignment Submission Tracker**.
2. The dashboard displays the total number of assignments.
3. The user enters the assignment title, subject, and due date.
4. The user clicks the **Add Assignment** button.
5. The new assignment appears in the assignment list.
6. The user can change the status to **Submitted, Pending, or Late**.
7. The user can select a subject from the filter option.
8. The application displays assignments belonging to the selected subject.
9. The dashboard automatically displays the updated assignment counts.
10. Faculty can use the dashboard to quickly identify pending and late assignments.

7. KEY REACT CONCEPTS USED

Components

The application is divided into reusable components such as the dashboard, assignment form, assignment list, and filter section.

useState

The useState Hook is used to store and update assignment data and submission statuses.

useEffect

The useEffect Hook can be used to perform actions whenever assignment data changes.

Props

Props are used to pass assignment information and functions between React components.

Event Handling

React event handlers are used for actions such as adding assignments, changing status, and filtering subjects.

Conditional Rendering

Conditional rendering is used to display different assignment status values such as **Submitted, Pending, and Late**.

Lists and Keys

The assignment records are displayed using React list rendering with unique keys.

8. EXPECTED OUTPUT

The final application provides a simple dashboard for managing college assignments.

Main Dashboard

The dashboard displays:

- **Total Assignments**
- **Submitted Assignments**
- **Pending Assignments**
- **Late Assignments**

Add Assignment Page/Section

The user can enter:

- Assignment Title
- Subject
- Due Date
- Submission Status

Assignment List

All assignments are displayed in an organized list or table with their current status.

Subject Filter

Faculty can select a subject to display only assignments related to that subject.

Screenshots to Include

1. **Dashboard/Home Page**
2. **Add Assignment Form**
3. **Assignment List**
4. **Subject Filter**
5. **Submitted/Pending/Late Status Display**

Insert the screenshots of your completed React application in this section.

9. CHALLENGES FACED

During the development of the project, some challenges were faced:

- Managing assignment data using React state.
- Updating assignment status correctly.
- Implementing subject-based filtering.
- Designing a simple and responsive user interface.
- Displaying dashboard counts dynamically.

These challenges were solved by using React Hooks, component-based development, JavaScript array methods, conditional rendering, and CSS styling.

10. LEARNING OUTCOMES

Through this project, I learned:

- Basics of React.js development.
- Creating reusable React components.
- Using useState and useEffect.
- Handling user events and form inputs.
- Managing and displaying dynamic data.
- Implementing filtering functionality.
- Designing responsive web pages using CSS.
- Using Git and GitHub for project management.
- Understanding the development process of a real-world web application.

11. CONCLUSION

The **College Assignment Submission Tracker** successfully provides a simple solution for managing and monitoring assignment submissions. It allows faculty to add assignments, update their status, filter assignments by subject, and view summary counts through a dashboard. The project demonstrates the practical use of React, JavaScript, HTML, and CSS in developing a real-world frontend web application. Overall, the project reduces manual assignment tracking and provides a clear and organized way to monitor submission progress.
